10. Approved FAQ: does NovaFlow guarantee faster support
11. Approved release note style

1. Approved article: routing conversations with workflow rules

NovaFlow CX workflow rules can route predictable conversations using conditions and actions configured by an administrator. A billing inbox, for example, might route messages containing a defined billing keyword to the billing team and add a billing tag.

Rules can assign a conversation, add or remove tags, change priority, and send internal notifications. They do not execute arbitrary Python code. If a team needs custom external logic, it can use a supported integration or build against the NovaFlow API.

Starter supports up to 5 active workflow rules, Growth 50, and Enterprise up to 250 under the standard reference. Teams should keep rules focused and review rule order when several rules can match the same conversation.

Why this wording is approved

The article describes actual rule behavior, keeps the plan limits visible, and avoids promising that automation will eliminate all manual support work.

Additional approved wording

This example keeps the language around approved article: routing conversations with workflow rules specific and scoped. It states what NovaFlow does, preserves any relevant limit, and avoids turning the feature into a universal business outcome.

A writer can change the sentence structure or shorten the example for another page, but the underlying product facts and conditions should stay the same.

Reuse notes

- Preserve the plan limit if the new context mentions a plan.
- Preserve integration qualifiers when an external provider is involved.
- Do not add a numerical result unless an approved source supports it.

2. Approved article: support reporting

NovaFlow CX reports help support teams review conversation volume, first-response time, resolution time, assignments, and tag-based patterns. Reports can be filtered by supported fields such as inbox, date range, team, and tag.

Reporting history depends on plan. Starter includes 30 days, Growth 12 months, and Enterprise up to 24 months. Saved report views remain subject to the same history window.

Teams that need cross-company analytics can export supported datasets and use their own reporting environment. NovaFlow reports are designed for support operations rather than as a replacement for a general data warehouse.

Why this wording is approved

The article states the reporting features and limits without making a performance claim about how much a customer's response time will improve.

Additional approved wording

This example keeps the language around approved article: support reporting specific and scoped. It states what NovaFlow does, preserves any relevant limit, and avoids turning the feature into a universal business outcome.

A writer can change the sentence structure or shorten the example for another page, but the underlying product facts and conditions should stay the same.

Reuse notes

- Preserve the plan limit if the new context mentions a plan.
- Preserve integration qualifiers when an external provider is involved.
- Do not add a numerical result unless an approved source supports it.

3. Approved article: account security

NovaFlow encrypts data in transit and at rest. Multi-factor authentication is available on all plans, and Enterprise customers can configure SAML single sign-on.

These controls are part of the platform's security approach. Customers should also manage user access, inbox permissions, and integration credentials according to their own security policies.

Enterprise audit export can support account review where the feature is included in the customer's plan.

Why this wording is approved

The article describes controls without promising that incidents are impossible or implying an unsupported certification.

Additional approved wording

This example keeps the language around approved article: account security specific and scoped. It states what NovaFlow does, preserves any relevant limit, and avoids turning the feature into a universal business outcome.

A writer can change the sentence structure or shorten the example for another page, but the underlying product facts and conditions should stay the same.

Reuse notes

- Preserve the plan limit if the new context mentions a plan.
- Preserve integration qualifiers when an external provider is involved.
- Do not add a numerical result unless an approved source supports it.

4. Approved article: Growth plan overview

Growth is designed for support teams that need more users, inboxes, workflow rules, and reporting history than Starter. The standard Growth plan supports up to 50 agent seats, 15 shared inboxes, 50 active workflow rules, and 12 months of reporting history.

Growth includes manual and scheduled CSV exports and 25 saved report views. Multi-factor authentication is available. SAML SSO and Enterprise audit export are not included in the standard Growth plan.

Teams should review the current plan reference before publishing detailed comparisons because commercial packaging can change over time.

Why this wording is approved

The plan values match the standard plan reference and the article does not borrow Enterprise capabilities.

Additional approved wording

This example keeps the language around approved article: growth plan overview specific and scoped. It states what NovaFlow does, preserves any relevant limit, and avoids turning the feature into a universal business outcome.

A writer can change the sentence structure or shorten the example for another page, but the underlying product facts and conditions should stay the same.

Reuse notes

- Preserve the plan limit if the new context mentions a plan.
- Preserve integration qualifiers when an external provider is involved.
- Do not add a numerical result unless an approved source supports it.

5. Approved help content: internal notes

Internal notes let team members discuss a conversation without sending the note to the customer. Users with access to the inbox can see notes according to their permissions.

Use internal notes for work context, handoffs, and collaboration. Do not use notes to store passwords, payment-card numbers, or other unnecessary sensitive information.

An internal note is different from a customer reply. Review the message type before sending when a conversation contains sensitive internal discussion.

Additional approved wording

This example keeps the language around approved help content: internal notes specific and scoped. It states what NovaFlow does, preserves any relevant limit, and avoids turning the feature into a universal business outcome.

A writer can change the sentence structure or shorten the example for another page, but the underlying product facts and conditions should stay the same.

Reuse notes

- Preserve the plan limit if the new context mentions a plan.
- Preserve integration qualifiers when an external provider is involved.
- Do not add a numerical result unless an approved source supports it.

6. Approved help content: saved reports

A saved report view stores the selected filters and report setup so the same view can be opened later. The underlying report still uses the data available inside the plan's reporting-history window.

Starter supports 5 saved views, Growth 25, and Enterprise 100. A saved view does not preserve data after it falls outside the available reporting-history period.

If an older view returns less data than expected, check the date range and plan history before recreating the report.

Additional approved wording

This example keeps the language around approved help content: saved reports specific and scoped. It states what NovaFlow does, preserves any relevant limit, and avoids turning the feature into a universal business outcome.

A writer can change the sentence structure or shorten the example for another page, but the underlying product facts and conditions should stay the same.

Reuse notes

- Preserve the plan limit if the new context mentions a plan.
- Preserve integration qualifiers when an external provider is involved.
- Do not add a numerical result unless an approved source supports it.

7. Approved article: integrations

NovaFlow connects with supported email, team-chat, CRM, and telephony services. Integration availability changes as providers are added or updated, so vendor-specific claims should be checked against the current catalog.

Telephony features are delivered through connected providers. NovaFlow is not itself a carrier, dialer, or full call-center system.

Customers may need a separate subscription with the external provider. External-service fees are not automatically included in a NovaFlow subscription.

Additional approved wording

This example keeps the language around approved article: integrations specific and scoped. It states what NovaFlow does, preserves any relevant limit, and avoids turning the feature into a universal business outcome.

A writer can change the sentence structure or shorten the example for another page, but the underlying product facts and conditions should stay the same.

Reuse notes

- Preserve the plan limit if the new context mentions a plan.
- Preserve integration qualifiers when an external provider is involved.
- Do not add a numerical result unless an approved source supports it.

8. Approved article: exports

Supported NovaFlow report datasets can be exported as CSV. Starter includes manual CSV export. Growth and Enterprise also support scheduled CSV export, and Enterprise can use SFTP delivery where configured.

Exports help teams use support data in spreadsheets, warehouses, or other reporting tools. Export availability does not mean every internal system field is included.

Once a file is downloaded or delivered to a customer's storage location, that copy is managed in the customer's environment.

Additional approved wording

This example keeps the language around approved article: exports specific and scoped. It states what NovaFlow does, preserves any relevant limit, and avoids turning the feature into a universal business outcome.

A writer can change the sentence structure or shorten the example for another page, but the underlying product facts and conditions should stay the same.

Reuse notes

- Preserve the plan limit if the new context mentions a plan.
- Preserve integration qualifiers when an external provider is involved.
- Do not add a numerical result unless an approved source supports it.

9. Approved FAQ: what happens when a rule matches

When a workflow rule matches, NovaFlow runs the configured actions in order. Other rules may also run depending on the account's rule order and conditions.

If two rules make different assignment changes, the final result depends on the order and whether later rules match the updated conversation state.

Use test conversations when changing important routing rules. If a rule behaves unexpectedly, disable it and review the conditions and order before adding another rule.

Additional approved wording

This example keeps the language around approved faq: what happens when a rule matches specific and scoped. It states what NovaFlow does, preserves any relevant limit, and avoids turning the feature into a universal business outcome.

A writer can change the sentence structure or shorten the example for another page, but the underlying product facts and conditions should stay the same.

Reuse notes

- Preserve the plan limit if the new context mentions a plan.
- Preserve integration qualifiers when an external provider is involved.
- Do not add a numerical result unless an approved source supports it.

10. Approved FAQ: does NovaFlow guarantee faster support

NovaFlow provides routing, collaboration, and reporting tools that can reduce repetitive coordination work. Actual response and resolution performance depends on staffing, workflow design, channel mix, customer behavior, and other factors.

Public content should not promise a universal percentage improvement unless an approved study or customer case supports the exact number and context.

Additional approved wording

This example keeps the language around approved faq: does novaflow guarantee faster support specific and scoped. It states what NovaFlow does, preserves any relevant limit, and avoids turning the feature into a universal business outcome.

A writer can change the sentence structure or shorten the example for another page, but the underlying product facts and conditions should stay the same.

Reuse notes

- Preserve the plan limit if the new context mentions a plan.
- Preserve integration qualifiers when an external provider is involved.
- Do not add a numerical result unless an approved source supports it.

11. Approved release note style

Release notes should say what changed, who it affects, and whether an administrator needs to take action. Avoid turning a small configuration change into a broad marketing claim.

Example: 'Growth and Enterprise administrators can now schedule CSV exports from the reporting area. Existing manual exports are unchanged.'

If a feature is limited by plan, include the plan in the release note instead of making the reader discover the limitation later.

Additional approved wording

This example keeps the language around approved release note style specific and scoped. It states what NovaFlow does, preserves any relevant limit, and avoids turning the feature into a universal business outcome.

A writer can change the sentence structure or shorten the example for another page, but the underlying product facts and conditions should stay the same.

Reuse notes

- Preserve the plan limit if the new context mentions a plan.
- Preserve integration qualifiers when an external provider is involved.
- Do not add a numerical result unless an approved source supports it.
