4. Security claims
5. Privacy and data claims
6. Comparative claims
7. Customer stories
8. Testimonials and quotations
9. Plans and pricing language
10. Integration and third-party claims
11. Escalation and exceptions

1. Purpose of the claims policy

This policy governs public claims about NovaFlow CX product behavior, security, customer outcomes, plan capabilities, and comparative performance. It applies to marketing pages, help content, sales collateral intended for broad reuse, product announcements, and approved customer stories.

The purpose is not to remove useful product language. It is to make sure a reader can distinguish a documented product fact from an interpretation, estimate, or marketing promise.

When a claim is not supported by an approved source, the writer should remove it, narrow it, or request review rather than inventing evidence.

Acceptable and unacceptable examples

An acceptable statement about purpose of the claims policy stays within the supplied evidence and keeps the scope clear. An unacceptable version usually adds a guarantee, a number, a certification, or a broader audience than the source supports.

Adding words such as 'up to', 'typically', or 'designed to' does not automatically make an unsupported claim acceptable. The underlying evidence still has to support the statement being made.

Reviewer reminder

- Check the exact wording of the source.
- Check whether the claim applies to one customer or all customers.
- Escalate unresolved source conflicts instead of choosing the more favorable wording.

2. Product capability claims

A capability claim must match current product documentation. If a feature is available only through an integration, content should not present it as a built-in capability.

Plan-specific capabilities must match the current plan reference. Old screenshots, sales notes, and previous proposals are not enough when the current reference differs.

If a capability is available only to selected customers or by contract, the content should say so.

Acceptable and unacceptable examples

An acceptable statement about product capability claims stays within the supplied evidence and keeps the scope clear. An unacceptable version usually adds a guarantee, a number, a certification, or a broader audience than the source supports.

Adding words such as 'up to', 'typically', or 'designed to' does not automatically make an unsupported claim acceptable. The underlying evidence still has to support the statement being made.

Reviewer reminder

- Check the exact wording of the source.
- Check whether the claim applies to one customer or all customers.
- Escalate unresolved source conflicts instead of choosing the more favorable wording.

3. Numerical performance claims

Claims such as 'save 60 percent', 'respond twice as fast', or 'reduce handling time by 30 minutes per case' require an approved study, case study, or measurement record that supports the exact number.

The source must identify what was measured and in what context. A number measured for one customer should not become a general product guarantee.

If the source supports an average, do not rewrite it as a guaranteed result. If the source supports a range, do not use only the most favorable endpoint without context.

Acceptable and unacceptable examples

An acceptable statement about numerical performance claims stays within the supplied evidence and keeps the scope clear. An unacceptable version usually adds a guarantee, a number, a certification, or a broader audience than the source supports.

Adding words such as 'up to', 'typically', or 'designed to' does not automatically make an unsupported claim acceptable. The underlying evidence still has to support the statement being made.

Reviewer reminder

- Check the exact wording of the source.
- Check whether the claim applies to one customer or all customers.
- Escalate unresolved source conflicts instead of choosing the more favorable wording.

4. Security claims

Security content should describe implemented controls such as encryption, MFA, SSO availability, access controls, and audit features. It should not promise that security incidents are impossible.

Prohibited public wording includes unhackable, impossible to breach, completely secure, zero risk, guaranteed security, and 100 percent secure.

A security feature should not be turned into a certification claim. SAML SSO does not by itself prove a compliance certification.

Acceptable and unacceptable examples

An acceptable statement about security claims stays within the supplied evidence and keeps the scope clear. An unacceptable version usually adds a guarantee, a number, a certification, or a broader audience than the source supports.

Adding words such as 'up to', 'typically', or 'designed to' does not automatically make an unsupported claim acceptable. The underlying evidence still has to support the statement being made.

Reviewer reminder

- Check the exact wording of the source.
- Check whether the claim applies to one customer or all customers.
- Escalate unresolved source conflicts instead of choosing the more favorable wording.

5. Privacy and data claims

Do not state that NovaFlow keeps all customer data forever or deletes all customer data after a plan's reporting-history period. Reporting history is a specific product limit and should not be generalized to every data lifecycle.

Do not promise a regional hosting location, deletion timetable, or legal compliance status unless the approved privacy or contractual documentation supports it.

Public examples should not include real personal customer data.

Acceptable and unacceptable examples

An acceptable statement about privacy and data claims stays within the supplied evidence and keeps the scope clear. An unacceptable version usually adds a guarantee, a number, a certification, or a broader audience than the source supports.

Adding words such as 'up to', 'typically', or 'designed to' does not automatically make an unsupported claim acceptable. The underlying evidence still has to support the statement being made.

Reviewer reminder

- Check the exact wording of the source.
- Check whether the claim applies to one customer or all customers.
- Escalate unresolved source conflicts instead of choosing the more favorable wording.

6. Comparative claims

Claims such as fastest, cheapest, most secure, number one, or better than a named competitor require current comparative evidence and review.

A feature comparison can be factual when the source is current and the compared feature is defined clearly. Avoid broad superiority language based on one feature.

If competitor information cannot be verified, remove the comparison rather than guessing.

Acceptable and unacceptable examples

An acceptable statement about comparative claims stays within the supplied evidence and keeps the scope clear. An unacceptable version usually adds a guarantee, a number, a certification, or a broader audience than the source supports.

Adding words such as 'up to', 'typically', or 'designed to' does not automatically make an unsupported claim acceptable. The underlying evidence still has to support the statement being made.

Reviewer reminder

- Check the exact wording of the source.
- Check whether the claim applies to one customer or all customers.
- Escalate unresolved source conflicts instead of choosing the more favorable wording.

7. Customer stories

A customer story may describe that customer's experience when the facts and quoted statements have been approved. Results should remain scoped to that customer.

A sentence such as 'Acme reduced manual routing work after introducing workflow rules' may be acceptable in an approved case study. Turning it into 'NovaFlow reduces routing work for every customer' is a broader claim.

Any numerical result requires documented measurement and approval.

Acceptable and unacceptable examples

An acceptable statement about customer stories stays within the supplied evidence and keeps the scope clear. An unacceptable version usually adds a guarantee, a number, a certification, or a broader audience than the source supports.

Adding words such as 'up to', 'typically', or 'designed to' does not automatically make an unsupported claim acceptable. The underlying evidence still has to support the statement being made.

Reviewer reminder

- Check the exact wording of the source.
- Check whether the claim applies to one customer or all customers.
- Escalate unresolved source conflicts instead of choosing the more favorable wording.

8. Testimonials and quotations

Quotes should preserve the customer's meaning. Minor edits for length or grammar require approval if they could change the substance.

A quote should not be edited to introduce a result or feature the customer did not describe.

Do not combine sentences from different speakers into one quotation.

Acceptable and unacceptable examples

An acceptable statement about testimonials and quotations stays within the supplied evidence and keeps the scope clear. An unacceptable version usually adds a guarantee, a number, a certification, or a broader audience than the source supports.

Adding words such as 'up to', 'typically', or 'designed to' does not automatically make an unsupported claim acceptable. The underlying evidence still has to support the statement being made.

Reviewer reminder

- Check the exact wording of the source.
- Check whether the claim applies to one customer or all customers.
- Escalate unresolved source conflicts instead of choosing the more favorable wording.

9. Plans and pricing language

Plan feature claims must use the current plan reference. Pricing amounts, discounts, or promotional terms require the current commercial source and may change more frequently than feature documentation.

Avoid saying unlimited unless the governing plan document explicitly says unlimited.

Where an Enterprise capability is negotiated, use negotiated or up to rather than implying every account receives the maximum.

Acceptable and unacceptable examples

An acceptable statement about plans and pricing language stays within the supplied evidence and keeps the scope clear.

An unacceptable version usually adds a guarantee, a number, a certification, or a broader audience than the source supports.

Adding words such as 'up to', 'typically', or 'designed to' does not automatically make an unsupported claim acceptable. The underlying evidence still has to support the statement being made.

Reviewer reminder

- Check the exact wording of the source.
- Check whether the claim applies to one customer or all customers.
- Escalate unresolved source conflicts instead of choosing the more favorable wording.

10. Integration and third-party claims

An integration statement should be checked against the current approved catalog. External provider behavior is not controlled by NovaFlow.

Do not promise that a third-party integration will always be available or that external-service fees are included unless an approved offer says so.

Telephony integrations do not make NovaFlow a native carrier or call-center system.

Acceptable and unacceptable examples

An acceptable statement about integration and third-party claims stays within the supplied evidence and keeps the scope clear. An unacceptable version usually adds a guarantee, a number, a certification, or a broader audience than the source supports.

Adding words such as 'up to', 'typically', or 'designed to' does not automatically make an unsupported claim acceptable. The underlying evidence still has to support the statement being made.

Reviewer reminder

- Check the exact wording of the source.
- Check whether the claim applies to one customer or all customers.
- Escalate unresolved source conflicts instead of choosing the more favorable wording.

11. Escalation and exceptions

If current sources conflict, the reviewer should identify the conflict and ask for the governing source. Do not choose the more favorable version simply because it reads better.

Legal, compliance, security, or customer-contract exceptions require the appropriate reviewer. The content team should not resolve those exceptions by inference.

A temporary approved exception should be documented with its scope and expiration if one applies.

Acceptable and unacceptable examples

An acceptable statement about escalation and exceptions stays within the supplied evidence and keeps the scope clear. An unacceptable version usually adds a guarantee, a number, a certification, or a broader audience than the source supports.

Adding words such as 'up to', 'typically', or 'designed to' does not automatically make an unsupported claim acceptable. The underlying evidence still has to support the statement being made.

Reviewer reminder

- Check the exact wording of the source.
- Check whether the claim applies to one customer or all customers.
- Escalate unresolved source conflicts instead of choosing the more favorable wording.
