1. Review purpose

The QA review checks whether a draft is accurate, supportable, complete enough for its purpose, and written in the approved product style. It is not a rewrite service for every sentence. A reviewer should distinguish material problems from harmless wording preferences.

Some drafts contain both correct and incorrect statements. Passing content should remain unflagged when it matches the source and style guidance.

Review example

For review purpose, a reviewer should capture the smallest useful issue. Quote or locate the problem, identify the governing source, and explain the difference. Avoid turning one issue into a paragraph of unrelated editorial preferences.

If the sentence is correct, leave it alone unless there is a meaningful style problem. A QA system that flags every paragraph creates more work and makes the useful issues harder to trust.

Quality check

- Would another reviewer understand why this issue was raised?
- Does the cited source actually support the finding?
- Would fixing the issue change accuracy, compliance, or reader understanding?

2. Issue categories

Category	Use when
Technical accuracy	A product capability, plan limit, or behavior is wrong
Unsupported claim	A performance, security, or comparative claim lacks approved evidence
Missing condition	A statement is broadly true but omits a condition that changes meaning
Terminology	Product naming or feature terminology is incorrect
Style/clarity	Wording is confusing, inflated, or inconsistent with the guide
Source conflict	Approved sources appear to disagree

A single issue may touch more than one category. Choose the category that best describes the main problem and mention secondary concerns in the explanation if needed.

Review example

For issue categories, a reviewer should capture the smallest useful issue. Quote or locate the problem, identify the governing source, and explain the difference. Avoid turning one issue into a paragraph of unrelated editorial preferences.

If the sentence is correct, leave it alone unless there is a meaningful style problem. A QA system that flags every paragraph creates more work and makes the useful issues harder to trust.

Quality check

- Would another reviewer understand why this issue was raised?
- Does the cited source actually support the finding?
- Would fixing the issue change accuracy, compliance, or reader understanding?

3. Severity

High severity is used for materially false product claims, unsupported security guarantees, serious compliance statements, or major plan misrepresentation. These issues should be corrected before publication.

Medium severity is used for misleading omissions, unsupported performance language that is less central, incorrect terminology that changes meaning, or a strong style problem that could mislead a reader.

Low severity is used for wording, readability, or consistency problems that do not materially change the product claim.

Do not inflate severity

A missing comma is not a high-severity issue. A sentence that says Starter has unlimited reporting history is high severity because it materially misstates the product.

Review example

For severity, a reviewer should capture the smallest useful issue. Quote or locate the problem, identify the governing source, and explain the difference. Avoid turning one issue into a paragraph of unrelated editorial preferences.

If the sentence is correct, leave it alone unless there is a meaningful style problem. A QA system that flags every paragraph creates more work and makes the useful issues harder to trust.

Quality check

- Would another reviewer understand why this issue was raised?
- Does the cited source actually support the finding?
- Would fixing the issue change accuracy, compliance, or reader understanding?

4. Evidence requirements

Every factual issue should point to a source section or source statement. The reviewer should be able to explain what the draft says, what the source says, and why the difference matters.

For an unsupported claim, the reviewer may point to the claims policy when no approved evidence exists in the supplied materials.

A source link is useful only if the cited section actually supports the issue. Do not attach a random source simply because it is related to the topic.

Review example

For evidence requirements, a reviewer should capture the smallest useful issue. Quote or locate the problem, identify the governing source, and explain the difference. Avoid turning one issue into a paragraph of unrelated editorial preferences.

If the sentence is correct, leave it alone unless there is a meaningful style problem. A QA system that flags every paragraph creates more work and makes the useful issues harder to trust.

Quality check

- Would another reviewer understand why this issue was raised?
- Does the cited source actually support the finding?
- Would fixing the issue change accuracy, compliance, or reader understanding?

5. False positives

A useful reviewer does not flag correct content simply because related words appear in a policy. For example, the reporting guide correctly states that NovaFlow shows first-response time. The existence of a policy against unsupported performance claims does not make the phrase first-response time itself a violation.

General qualitative wording can be acceptable. 'Helps teams reduce repetitive routing work' is not the same as claiming a guaranteed numerical reduction.

If a sentence is accurate but could be written more elegantly, decide whether the change is worth a low-severity style issue or whether the sentence should pass.

Review example

For false positives, a reviewer should capture the smallest useful issue. Quote or locate the problem, identify the governing source, and explain the difference. Avoid turning one issue into a paragraph of unrelated editorial preferences.

If the sentence is correct, leave it alone unless there is a meaningful style problem. A QA system that flags every paragraph creates more work and makes the useful issues harder to trust.

Quality check

- Would another reviewer understand why this issue was raised?
- Does the cited source actually support the finding?
- Would fixing the issue change accuracy, compliance, or reader understanding?

6. Missing information

A draft does not need to repeat the whole product manual. Flag an omission only when the missing condition changes the meaning or would predictably mislead the intended reader.

If a pricing comparison says Enterprise has 24 months of history, omitting up to changes the scope and should be reviewed. If a short overview does not list every available report, that is not automatically a completeness issue.

Review example

For missing information, a reviewer should capture the smallest useful issue. Quote or locate the problem, identify the governing source, and explain the difference. Avoid turning one issue into a paragraph of unrelated editorial preferences.

If the sentence is correct, leave it alone unless there is a meaningful style problem. A QA system that flags every paragraph creates more work and makes the useful issues harder to trust.

Quality check

- Would another reviewer understand why this issue was raised?
- Does the cited source actually support the finding?
- Would fixing the issue change accuracy, compliance, or reader understanding?

7. Plan review

Plan limits are checked against the standard plan reference. Pay attention to units, up to language, active versus disabled workflow rules, and differences between plan levels.

A common error is combining a Growth price or label with an Enterprise feature. Another is turning negotiated Enterprise values into unlimited public capabilities.

When a draft cites a customer-specific contract, the review should use that contract if it is part of the approved source set for the assignment.

Review example

For plan review, a reviewer should capture the smallest useful issue. Quote or locate the problem, identify the governing source, and explain the difference. Avoid turning one issue into a paragraph of unrelated editorial preferences.

If the sentence is correct, leave it alone unless there is a meaningful style problem. A QA system that flags every paragraph creates more work and makes the useful issues harder to trust.

Quality check

- Would another reviewer understand why this issue was raised?
- Does the cited source actually support the finding?
- Would fixing the issue change accuracy, compliance, or reader understanding?

8. Security review

Security review focuses on whether the draft describes actual controls and avoids guarantees. Encryption, MFA, and SSO can be factual. 'Cannot be hacked' is not.

Do not infer a certification from security features. If a certification is not in the supplied approved source, do not add it.

A factual control can still be written poorly. Separate technical accuracy from style where useful.

Review example

For security review, a reviewer should capture the smallest useful issue. Quote or locate the problem, identify the governing source, and explain the difference. Avoid turning one issue into a paragraph of unrelated editorial preferences.

If the sentence is correct, leave it alone unless there is a meaningful style problem. A QA system that flags every paragraph creates more work and makes the useful issues harder to trust.

Quality check

- Would another reviewer understand why this issue was raised?
- Does the cited source actually support the finding?
- Would fixing the issue change accuracy, compliance, or reader understanding?

9. Performance and ROI review

Performance and ROI numbers require evidence. Look for the number, what it measures, the comparison point, and whether the scope is one customer or all customers.

An unsupported '60 percent cost reduction' should not be softened into 'up to 60 percent' unless a source supports that figure. Adding up to does not create evidence.

When the product has a feature that plausibly saves time, qualitative wording can be used if it does not promise a measured result.

Review example

For performance and roi review, a reviewer should capture the smallest useful issue. Quote or locate the problem, identify the governing source, and explain the difference. Avoid turning one issue into a paragraph of unrelated editorial preferences.

If the sentence is correct, leave it alone unless there is a meaningful style problem. A QA system that flags every paragraph creates more work and makes the useful issues harder to trust.

Quality check

- Would another reviewer understand why this issue was raised?
- Does the cited source actually support the finding?
- Would fixing the issue change accuracy, compliance, or reader understanding?

10. Writing-quality review

The style guide favors direct product language. Flag hype when it distracts from accuracy or creates a claim. Do not mark every adjective as an issue.

Check naming, headings, sentence length, unclear pronouns, and whether a paragraph mixes several unrelated claims. Low-severity style issues should remain useful and specific.

A reviewer should not rewrite the author's voice into a generic template when the original is already clear and compliant.

Review example

For writing-quality review, a reviewer should capture the smallest useful issue. Quote or locate the problem, identify the governing source, and explain the difference. Avoid turning one issue into a paragraph of unrelated editorial preferences.

If the sentence is correct, leave it alone unless there is a meaningful style problem. A QA system that flags every paragraph creates more work and makes the useful issues harder to trust.

Quality check

- Would another reviewer understand why this issue was raised?
- Does the cited source actually support the finding?
- Would fixing the issue change accuracy, compliance, or reader understanding?

11. Review output

Each issue should include an identifier, category, severity, location or quoted fragment, explanation, and supporting source. A short suggested correction may be included when the fix is straightforward.

Field	Example
issue_id	ISS-004
category	technical_accuracy
severity	high
location	Plans section, paragraph 2
problem	Draft says reporting history is unlimited
source	Plans and Limits Reference, Reporting-history limits

The overall status should reflect the issues that remain. A document with one high-severity issue should not be marked pass.

Review example

For review output, a reviewer should capture the smallest useful issue. Quote or locate the problem, identify the governing source, and explain the difference. Avoid turning one issue into a paragraph of unrelated editorial preferences.

If the sentence is correct, leave it alone unless there is a meaningful style problem. A QA system that flags every paragraph creates more work and makes the useful issues harder to trust.

- Does the cited source actually support the finding?
- Would fixing the issue change accuracy, compliance, or reader understanding?
