1. How to use this reference

This guide is the standard public-plan reference for NovaFlow CX. Customer-specific contracts may contain negotiated values, especially for Enterprise. Public product content should use the standard values in this guide unless a customer-specific document has been approved for that content.

Writers should avoid phrases such as unlimited, unrestricted, or no limits unless the table explicitly says so. Enterprise flexibility does not mean every Enterprise feature is unlimited.

Area	Starter	Growth	Enterprise
Agent seats	Up to 10	Up to 50	Negotiated
Shared inboxes	3	15	Negotiated
Active workflow rules	5	50	Up to 250 unless contracted otherwise
Reporting history	30 days	12 months	Up to 24 months
Saved report views	5	25	100
Data export	Manual CSV	Manual + scheduled CSV	Manual + scheduled CSV + SFTP option
SSO	No	No	SAML SSO
MFA	Available	Available	Available
Audit export	No	No	Available

Interpretation example

The values in how to use this reference should be read as current standard public limits. A customer-specific Enterprise agreement can override a standard value for that account, but it does not change the wording used for the general product site or help center.

When a plan limit is described with 'up to', keep that qualifier. Removing it can turn a maximum standard value into a promise that every account receives that exact amount.

Common review checks

- Confirm the plan name and the unit are both correct.
- Confirm the source says unlimited before using the word unlimited.
- Do not mix negotiated Enterprise values into standard Starter or Growth content.

2. Starter plan

Starter is intended for small support teams. It includes up to 10 active agent seats, three shared inboxes, five active workflow rules, 30 days of reporting history, and five saved report views.

Manual CSV export is available. MFA is available. SAML SSO, audit export, scheduled exports, and SFTP delivery are not included in the standard Starter plan.

Starter does not include unlimited workflow rules or unlimited reporting history. Disabled rules do not count toward the active-rule limit.

Interpretation example

The values in starter plan should be read as current standard public limits. A customer-specific Enterprise agreement can override a standard value for that account, but it does not change the wording used for the general product site or help center.

When a plan limit is described with 'up to', keep that qualifier. Removing it can turn a maximum standard value into a promise that every account receives that exact amount.

Common review checks

- Confirm the plan name and the unit are both correct.
- Confirm the source says unlimited before using the word unlimited.
- Do not mix negotiated Enterprise values into standard Starter or Growth content.

3. Growth plan

Growth supports up to 50 active agent seats, fifteen shared inboxes, fifty active workflow rules, 12 months of reporting history, and twenty-five saved report views.

Growth includes manual and scheduled CSV export. MFA is available. Standard Growth does not include SAML SSO or Enterprise audit export.

A Growth article should not borrow the Enterprise 24-month reporting window or SSO capability.

Interpretation example

The values in growth plan should be read as current standard public limits. A customer-specific Enterprise agreement can override a standard value for that account, but it does not change the wording used for the general product site or help center.

When a plan limit is described with 'up to', keep that qualifier. Removing it can turn a maximum standard value into a promise that every account receives that exact amount.

Common review checks

- Confirm the plan name and the unit are both correct.
- Confirm the source says unlimited before using the word unlimited.
- Do not mix negotiated Enterprise values into standard Starter or Growth content.

4. Enterprise plan

Enterprise supports negotiated agent and inbox limits. The standard reference includes up to 250 active workflow rules unless a contract states otherwise, up to 24 months of reporting history, and one hundred saved report views.

Enterprise includes SAML SSO, audit export, manual and scheduled CSV export, and an SFTP export option where configured.

The phrase 'up to 24 months' matters. Public content should not turn it into 'unlimited history'. Some contracts may specify a different period, but the standard reference remains up to 24 months.

Interpretation example

The values in enterprise plan should be read as current standard public limits. A customer-specific Enterprise agreement can override a standard value for that account, but it does not change the wording used for the general product site or help center.

When a plan limit is described with 'up to', keep that qualifier. Removing it can turn a maximum standard value into a promise that every account receives that exact amount.

Common review checks

- Confirm the plan name and the unit are both correct.
- Confirm the source says unlimited before using the word unlimited.
- Do not mix negotiated Enterprise values into standard Starter or Growth content.

5. Agent-seat counting

An active agent seat refers to a user who can sign in and work in the product under an agent-capable role. Suspended accounts do not continue operating as active agents. Billing treatment follows the subscription terms and billing cycle.

Reporting viewers may be handled differently from full agents depending on the contract. Public content should avoid inventing seat-billing details beyond the approved plan reference.

Interpretation example

The values in agent-seat counting should be read as current standard public limits. A customer-specific Enterprise agreement can override a standard value for that account, but it does not change the wording used for the general product site or help center.

When a plan limit is described with 'up to', keep that qualifier. Removing it can turn a maximum standard value into a promise that every account receives that exact amount.

Common review checks

- Confirm the plan name and the unit are both correct.
- Confirm the source says unlimited before using the word unlimited.
- Do not mix negotiated Enterprise values into standard Starter or Growth content.

6. Workflow-rule limits

Starter supports five active rules. Growth supports fifty. Enterprise supports up to two hundred fifty under the standard reference. Disabled rules are retained for editing and audit purposes but do not count toward the active limit.

A writer should not describe the workflow engine as unlimited on Starter or Growth. Enterprise should also not be called unlimited unless a specific contract says so, which is not the standard public position.

Interpretation example

The values in workflow-rule limits should be read as current standard public limits. A customer-specific Enterprise agreement can override a standard value for that account, but it does not change the wording used for the general product site or help center.

When a plan limit is described with 'up to', keep that qualifier. Removing it can turn a maximum standard value into a promise that every account receives that exact amount.

Common review checks

- Confirm the plan name and the unit are both correct.
- Confirm the source says unlimited before using the word unlimited.
- Do not mix negotiated Enterprise values into standard Starter or Growth content.

7. Reporting-history limits

Reporting history controls how far back standard reports can query. Starter: 30 days. Growth: 12 months. Enterprise: up to 24 months.

These limits are separate from the existence of conversation records required for normal product operation. Writers should not collapse every data lifecycle into the reporting-history number unless the product documentation explicitly does so.

No standard plan includes unlimited reporting history.

Interpretation example

The values in reporting-history limits should be read as current standard public limits. A customer-specific Enterprise agreement can override a standard value for that account, but it does not change the wording used for the general product site or help center.

When a plan limit is described with 'up to', keep that qualifier. Removing it can turn a maximum standard value into a promise that every account receives that exact amount.

Common review checks

- Confirm the plan name and the unit are both correct.
- Confirm the source says unlimited before using the word unlimited.
- Do not mix negotiated Enterprise values into standard Starter or Growth content.

8. Export availability

Manual CSV export is available on Starter, Growth, and Enterprise. Scheduled CSV is available on Growth and Enterprise. Enterprise also supports SFTP delivery where configured.

An export may be limited by dataset, date range, and operational controls. Do not promise instant export of every field or unlimited volume.

Interpretation example

The values in export availability should be read as current standard public limits. A customer-specific Enterprise agreement can override a standard value for that account, but it does not change the wording used for the general product site or help center.

When a plan limit is described with 'up to', keep that qualifier. Removing it can turn a maximum standard value into a promise that every account receives that exact amount.

Common review checks

- Confirm the plan name and the unit are both correct.
- Confirm the source says unlimited before using the word unlimited.
- Do not mix negotiated Enterprise values into standard Starter or Growth content.

9. Authentication and security by plan

MFA is available to users on all standard plans. SAML SSO is an Enterprise feature. Encryption in transit and at rest applies to the platform generally and is not positioned as a paid add-on.

Security controls should be described accurately. Plan comparisons should not imply Starter is insecure simply because it does not include SAML SSO.

Interpretation example

The values in authentication and security by plan should be read as current standard public limits. A customer-specific Enterprise agreement can override a standard value for that account, but it does not change the wording used for the general product site or help center.

When a plan limit is described with 'up to', keep that qualifier. Removing it can turn a maximum standard value into a promise that every account receives that exact amount.

Common review checks

- Confirm the plan name and the unit are both correct.
- Confirm the source says unlimited before using the word unlimited.
- Do not mix negotiated Enterprise values into standard Starter or Growth content.

10. Saved report views

Saved report views preserve filters and report configuration. Starter supports five, Growth twenty-five, and Enterprise one hundred.

The number of saved views does not change the plan's reporting-history window. A saved view cannot retrieve data that has moved outside the available history.

Interpretation example

The values in saved report views should be read as current standard public limits. A customer-specific Enterprise agreement can override a standard value for that account, but it does not change the wording used for the general product site or help center.

When a plan limit is described with 'up to', keep that qualifier. Removing it can turn a maximum standard value into a promise that every account receives that exact amount.

Common review checks

- Confirm the plan name and the unit are both correct.
- Confirm the source says unlimited before using the word unlimited.
- Do not mix negotiated Enterprise values into standard Starter or Growth content.

11. Customer-specific exceptions

Enterprise contracts can contain negotiated limits. A customer-specific statement should be reviewed against the actual contract before publication. The public website and general help content should continue using the standard reference.

A sales note or old proposal is not automatically an approved source for current product content. If a limit appears to conflict with this reference, the writer should ask which source governs the content rather than choosing the more generous number.

Interpretation example

The values in customer-specific exceptions should be read as current standard public limits. A customer-specific Enterprise agreement can override a standard value for that account, but it does not change the wording used for the general product site or help center.

When a plan limit is described with 'up to', keep that qualifier. Removing it can turn a maximum standard value into a promise that every account receives that exact amount.

Common review checks

- Confirm the plan name and the unit are both correct.
- Confirm the source says unlimited before using the word unlimited.
- Do not mix negotiated Enterprise values into standard Starter or Growth content.
