10. October release notes
11. November release notes

1. January release notes

Growth and Enterprise administrators can now schedule CSV exports from the reporting area. Existing manual CSV export remains available on Starter, Growth, and Enterprise.

The release did not change reporting-history limits. Starter remains 30 days, Growth 12 months, and Enterprise up to 24 months.

The scheduled-export release did not add SFTP to Growth. SFTP delivery remains an Enterprise option where configured.

Administrator note

The change described in January release notes applies only to the feature stated in the release. It should not be read as a change to unrelated plan limits, retention, security controls, or integration responsibilities.

Older content may need an update when a feature changes. The release note is useful for deciding whether a prior article is stale, but it should be read alongside the current product reference.

Content note

- Use the new behavior only after the stated release.
- Do not infer unrelated feature changes.
- Keep plan availability exactly as stated.

2. February release notes

Saved report views were expanded to 5 on Starter, 25 on Growth, and 100 on Enterprise. Existing saved views continue to work.

A saved view stores filters and report configuration. It does not create permanent storage outside the plan's reporting-history window.

The reporting page now displays the active date-range limit more clearly when a requested range exceeds plan history.

Administrator note

The change described in february release notes applies only to the feature stated in the release. It should not be read as a change to unrelated plan limits, retention, security controls, or integration responsibilities.

Older content may need an update when a feature changes. The release note is useful for deciding whether a prior article is stale, but it should be read alongside the current product reference.

Content note

- Use the new behavior only after the stated release.
- Do not infer unrelated feature changes.
- Keep plan availability exactly as stated.

3. March release notes

Workflow-rule testing now shows the matched conditions and actions before an administrator enables a new rule. This change is available across plans.

Plan active-rule limits remain 5 on Starter, 50 on Growth, and up to 250 on Enterprise under the standard reference.

The release did not add arbitrary code execution to the rule editor.

Administrator note

The change described in march release notes applies only to the feature stated in the release. It should not be read as a change to unrelated plan limits, retention, security controls, or integration responsibilities.

Older content may need an update when a feature changes. The release note is useful for deciding whether a prior article is stale, but it should be read alongside the current product reference.

Content note

- Use the new behavior only after the stated release.
- Do not infer unrelated feature changes.
- Keep plan availability exactly as stated.

4. April release notes

Enterprise audit export added new event fields for user suspension and integration reconnection. The feature remains Enterprise-only.

MFA remains available on all plans. SAML SSO remains Enterprise.

The change should not be described as a new security certification.

Administrator note

The change described in april release notes applies only to the feature stated in the release. It should not be read as a change to unrelated plan limits, retention, security controls, or integration responsibilities.

Older content may need an update when a feature changes. The release note is useful for deciding whether a prior article is stale, but it should be read alongside the current product reference.

Content note

- Use the new behavior only after the stated release.
- Do not infer unrelated feature changes.
- Keep plan availability exactly as stated.

5. May release notes

The reporting interface added clearer labels for first-response and resolution metrics. The calculation continues to use account events and business-hour configuration where applicable.

No universal response-time guarantee was introduced.

Marketing material should continue to avoid numerical improvement claims without approved evidence.

Administrator note

The change described in may release notes applies only to the feature stated in the release. It should not be read as a change to unrelated plan limits, retention, security controls, or integration responsibilities.

Older content may need an update when a feature changes. The release note is useful for deciding whether a prior article is stale, but it should be read alongside the current product reference.

Content note

- Use the new behavior only after the stated release.
- Do not infer unrelated feature changes.
- Keep plan availability exactly as stated.

6. June release notes

Integration settings now show a warning when a connected provider token is close to expiration where the provider exposes that information.

The integration catalog remains subject to change. Vendor-specific content should still use the current approved list.

NovaFlow did not become a native telephony carrier as part of this release.

Administrator note

The change described in June release notes applies only to the feature stated in the release. It should not be read as a change to unrelated plan limits, retention, security controls, or integration responsibilities.

Older content may need an update when a feature changes. The release note is useful for deciding whether a prior article is stale, but it should be read alongside the current product reference.

Content note

- Use the new behavior only after the stated release.
- Do not infer unrelated feature changes.
- Keep plan availability exactly as stated.

7. July release notes

Growth scheduled exports can now include two additional supported report fields. Enterprise SFTP exports received the same fields.

Starter manual exports remain available.

The release did not remove export size or frequency controls.

Administrator note

The change described in July release notes applies only to the feature stated in the release. It should not be read as a change to unrelated plan limits, retention, security controls, or integration responsibilities.

Older content may need an update when a feature changes. The release note is useful for deciding whether a prior article is stale, but it should be read alongside the current product reference.

Content note

- Use the new behavior only after the stated release.
- Do not infer unrelated feature changes.
- Keep plan availability exactly as stated.

8. August release notes

Workflow-rule history now displays the administrator who last changed a rule. This helps teams review configuration changes.

Disabled rules remain editable and do not count toward active-rule limits.

The feature does not create unlimited rule capacity.

Administrator note

The change described in august release notes applies only to the feature stated in the release. It should not be read as a change to unrelated plan limits, retention, security controls, or integration responsibilities.

Older content may need an update when a feature changes. The release note is useful for deciding whether a prior article is stale, but it should be read alongside the current product reference.

Content note

- Use the new behavior only after the stated release.
- Do not infer unrelated feature changes.
- Keep plan availability exactly as stated.

9. September release notes

Enterprise SSO setup added a validation step that checks required identity-provider fields before activation.

This reduces common configuration errors but does not guarantee that external identity-provider settings are correct.

MFA remains available independently of Enterprise SSO.

Administrator note

The change described in september release notes applies only to the feature stated in the release. It should not be read as a change to unrelated plan limits, retention, security controls, or integration responsibilities.

Older content may need an update when a feature changes. The release note is useful for deciding whether a prior article is stale, but it should be read alongside the current product reference.

Content note

- Use the new behavior only after the stated release.
- Do not infer unrelated feature changes.
- Keep plan availability exactly as stated.

10. October release notes

The conversation page now separates internal notes more clearly from customer replies in the composer.

The permissions model did not change. Users still need appropriate inbox access to see conversation content.

Tags continue to organize work but do not grant access by themselves.

Administrator note

The change described in october release notes applies only to the feature stated in the release. It should not be read as a change to unrelated plan limits, retention, security controls, or integration responsibilities.

Older content may need an update when a feature changes. The release note is useful for deciding whether a prior article is stale, but it should be read alongside the current product reference.

Content note

- Use the new behavior only after the stated release.
- Do not infer unrelated feature changes.
- Keep plan availability exactly as stated.

11. November release notes

Reporting export jobs now show clearer progress and failure messages for large date ranges.

The change improves visibility but does not make every export instant or unlimited.

Customers remain responsible for copies stored outside NovaFlow after export.

Administrator note

The change described in november release notes applies only to the feature stated in the release. It should not be read as a change to unrelated plan limits, retention, security controls, or integration responsibilities.

Older content may need an update when a feature changes. The release note is useful for deciding whether a prior article is stale, but it should be read alongside the current product reference.

Content note

- Use the new behavior only after the stated release.
- Do not infer unrelated feature changes.
- Keep plan availability exactly as stated.
